

Pitch the Pop

(and Other Sugar Beverages)

Are you one of the millions of people who cannot start their day without a soda pop? Consider this: One 20 oz bottle of regular pop has around 15 -19 teaspoons of sugar. This is bad enough for adults, but imagine the effect it has on a child's smaller body. So what does all that sugar and fizz do?

Tooth Trauma

Sugar and acid combine to wear away our tooth enamel and increase the risk of cavities. The average teen consumes 15 teaspoons sugar daily. The acid (which gives pop its fizz) takes calcium out of the tooth leaving teeth softer and more prone to decay. **BEWARE:** Diet pop contains less sugar, but the same amount of acid. Energy and sports drink can cause more damage to your teeth than soda pop!

Bad To The Bones

Studies have shown that females who drink pop regularly have a lower bone density than those who drink no pop. In addition, pop often replaces milk and other calcium-rich beverages. This combination increase risk for broken bones and osteoporosis.

Weight Gain

A 20 oz regular pop contains 240-290 calories. You get the same number of calories in 4 large apples, 80 baby carrots or 15 cups of air popped popcorn. Give up 20 oz a day for a year and you'll save 6200 teaspoons of sugar and could lose up to 26 pounds!

Nausea, Headaches

Energy drinks can contain up to 150 mg caffeine...twice as much as a cup of coffee and 4 times more than what is found in soda pop. They can also cause rapid or irregular heartbeats, medication interactions, seizures and dehydration.

What Else?

Persons who drink pop daily have an increased risk of type 2 diabetes, being overweight and are more likely to burp more and have more stomach irritations.

Rethink Your Drink?

	Recommended Servings per Day
Water	Males: 104 oz Females: 72 oz
Unsweetened tea (black, green, herbal)	Up to 64 oz
Unsweetened coffee or tea	Up to 32 oz
